

Benefits of a Transmission Maintenance Service

1. New fluid restores the holding power between the clutches, reducing slip and heat production.
2. At the same time, flushing the old fluid washes away tiny particles of clutch material and metal shavings. Those particles clog passages and wedge between moving parts, causing wear throughout the transmission. Changing the fluid eliminates those particles and the wear they cause.
3. The net result of changing the fluid is to provide better lubrication, improved the holding ability, and reduced heat. So your transmission works better for years longer, which means you're less likely to face a major transmission repair.
4. When possible, adding an external filter to the cooler line removes dirt particles that make it past the internal filter.

A complete transmission service should include:

- ✓ Road testing the vehicle before and after the transmission service
- ✓ Draining old fluid, Removing and examining the sump or pan (where possible)
- ✓ Replacing or cleaning the screen or filter
- ✓ Cleaning the pan
- ✓ Reinstalling the pan with a new pan gasket
- ✓ Make necessary adjustments (relearn shift adapts when necessary)
- ✓ Add new, high quality ATF
- ✓ Adding a friction modifier or additive package (model specific)
